

# Conoscopy

# Theoretical background

# Theoretical background

$$R = \rho(n_o - n_e)\sin^2\theta = d(n_o - n_e)\sin^2\theta/\cos\psi$$

$$R = \rho(n_z - n_x)\sin\theta_1\sin\theta_2 = d(n_z - n_x)\sin\theta_1\sin\theta_2/\cos\psi,$$

# Theoretical background

A polariscopic equation adjusted for conoscopic setup:  
(for uniaxial setup)

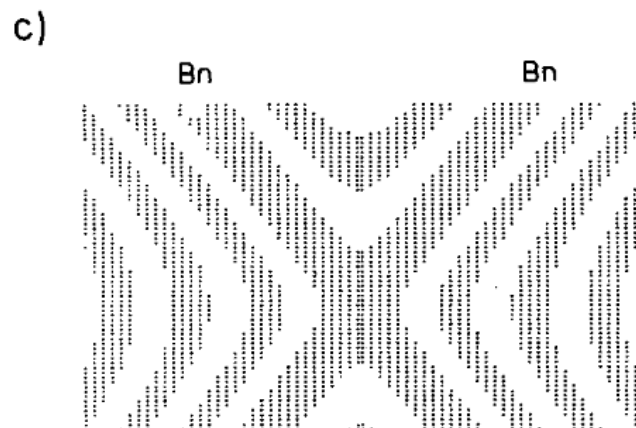

$$I = I_{\max} \sin^2 2\alpha \sin^2 [(\pi\rho/\lambda) (n_o - n_e) \sin^2 \theta]$$

(for biaxial setup)

$$I = I_{\max} \sin^2 2\alpha \sin^2 [\pi\rho/\lambda) (n_z - n_x) \sin\theta_1 \sin\theta_2]$$

# Methodology of measurement

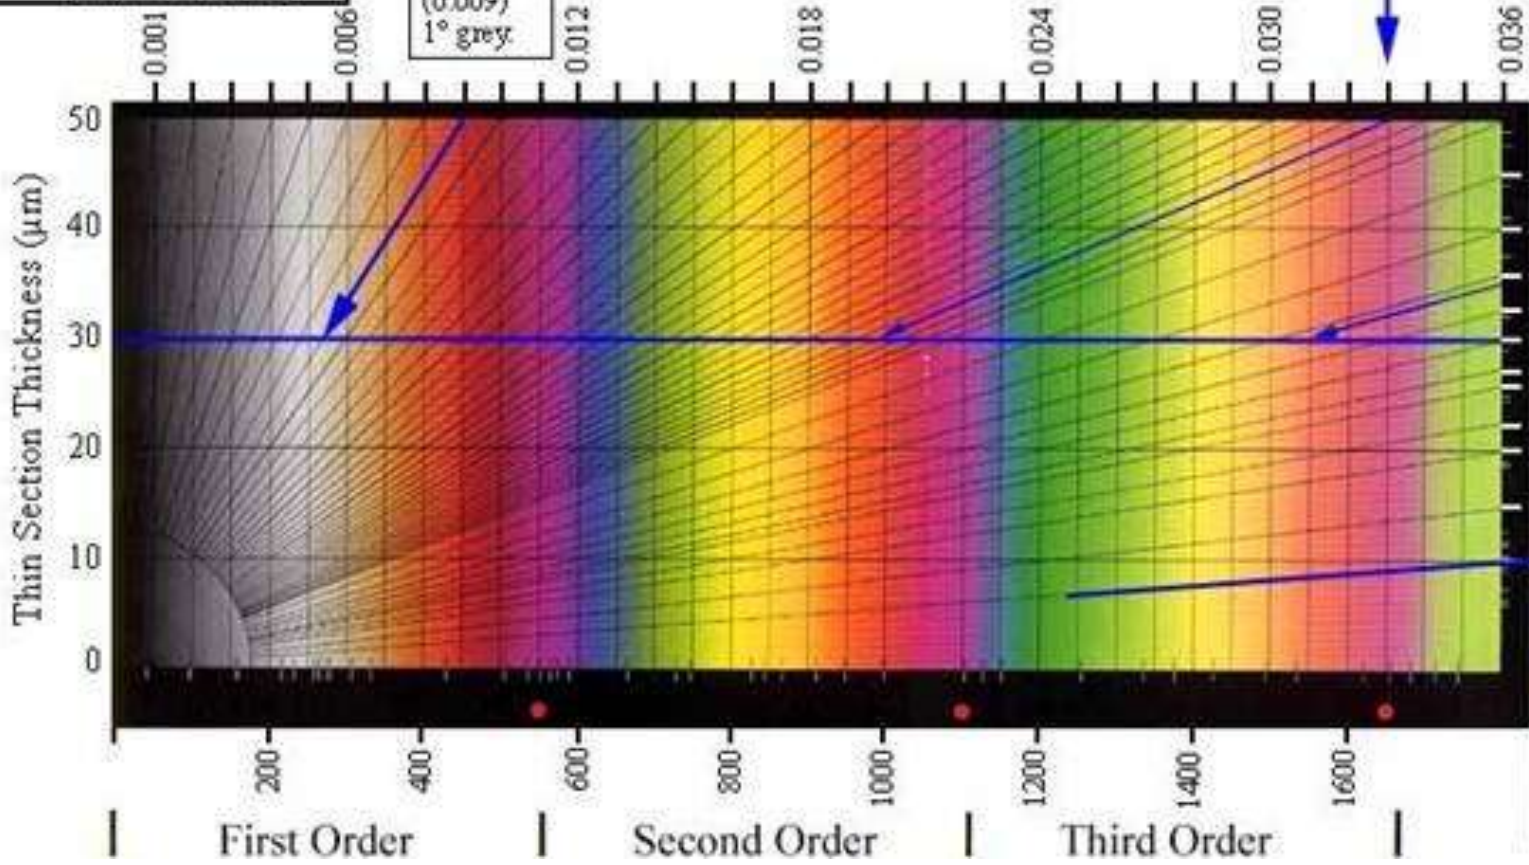

Michel Levy Colour Chart

### BIREFRINGENCE

QUARTZ  
(0.009)  
1° grey

Forsterite (0.033)

OLIVINE  
Commonly ranges from 2° orange to 3° blue and green.  
Colour may vary from 2° orange to 3° orange.

Fayalite (0.052)

CARBONATES  
including calcite and dolomite - very high birefringence.  
Birefringence and standard thickness lines meet off the chart scale.
